

IT management is the practice of overseeing and administering an organization's technology infrastructure and services, while IT security is the specific discipline focused on protecting that infrastructure and the data it holds from threats and unauthorized access. Think of IT management as the broader category of running the entire IT department, and IT security as a critical function within that department dedicated to safeguarding the assets.

IT Management, IT Security

Salem, Tamilnadu

IT management is the oversight of an organization's information technology systems, ensuring they operate efficiently and support business goals, while IT security is the practice of protecting these IT assets from unauthorized access, attacks, and damage.

IT Management:

- Planning and directing IT-related activities.
- Ensuring systems are secure and capable of supporting business operations.
- Optimizing performance and efficiency of IT systems.

IT security:

- Safeguarding data and systems to maintain confidentiality, integrity, and availability.
- Implementing policies, procedures, and controls to prevent security threats like malware, ransomware, and phishing.

Hyundai

Security Supervisor

Oragadam, Tamilnadu

- Led a team of security professionals in monitoring and protecting critical infrastructure, preventing a major data breach.
- Conducted risk assessments and vulnerability scans, identifying and mitigating potential security threats.
- Provided security awareness training and education to employees, enhancing overall security posture.

Projects

SMS Spam Detection System using NLP Neural Network

- An SMS spam detection system using Natural Language Processing (NLP) and neural networks operates by processing the text content of SMS messages to classify them as either "spam" or "ham" (legitimate).
- **Natural Language Processing (NLP):** This is a field of artificial intelligence that enables computers to understand, interpret, and generate human language. In the context of SMS spam detection, NLP is used to:
- **Preprocess the text:** This involves tasks like converting text to lowercase, removing punctuation, numbers, and stop words (common words like "the," "a," "is"), and potentially tokenizing (breaking down into words or sub-word units) and stemming/lemmatizing (reducing words to their root form).
- **Feature extraction:** NLP techniques like TF-IDF (Term Frequency-Inverse Document Frequency) or word embeddings.

Neural Network:

- This is a type of machine learning model inspired by the structure and function of the human brain. For SMS spam detection, various types of neural networks can be employed:
- **Recurrent Neural Networks (RNNs) like LSTMs (Long Short-Term Memory) or GRUs (Gated Recurrent Units):** These are particularly well-suited for sequential data like text, as they can capture dependencies and context within the message sequence.

The system typically follows these steps:

- **Data Collection:** A dataset of SMS messages labeled as either spam or ham is collected.
- **Preprocessing:** NLP techniques are applied to clean and prepare the text data.
- **Feature Engineering/Embedding:** The preprocessed text is transformed into numerical features or embeddings using NLP methods.
- **Model Training:** The neural network is trained on this labeled dataset, learning to identify patterns and characteristics that distinguish spam from legitimate messages.
- **Prediction:** Once trained, the model can then take new, unseen SMS messages, preprocess them, extract features, and predict whether they are spam or ham.

Skills

Microsoft Excel:

- A spreadsheet program developed by Microsoft that organizes, calculates, and analyzes data in a grid of rows and columns. It is used for tasks like data management, financial modeling, and creating charts and includes features such as formulas, pivot tables, and macro programming (VBA) to enhance productivity.

IT management:

- The oversight and administration of an organization's information technology systems, encompassing hardware, software, networks, and data to meet business objectives and ensure efficiency, security, and compliance.

Security Supervisor:

- Oversees an organization's security operations by leading a team of security staff to protect people, property, and assets.

Decision Making:

- The process of selecting a course of action from multiple available options, often after defining a problem, gathering information, and weighing alternatives.

IT Security:

- Protecting digital systems, networks, and data from unauthorized access, cyberattacks, and other threats.
